## 1 Escape Velocity from Dust Disk

Turekian (2014), in Section 6.1.2.2, gives an escape velocity in relation to a gravitational focusing factor. See Equation 1.

$$F_g = 1 + \frac{v_{esc}^2}{v_{rel}^2} \quad (1)$$

In Equation 1,  $v_{esc}$  is the body's escape velocity, and  $v_{rel}$  is the escape velocity of other particles in the body's environment.

It is unclear whether this is the right approach. Can a dust disk be considered a 'body' in this context?

## 2 Lifetime of Biological Material on Rocks in Space

Ginsburg et al. (2018) gives

$$f_{survived} = e^{-\frac{t}{\tau_{bio}}} \quad (2)$$

In Equation 2,  $\tau_{bio}$  is the biological lifetime, and  $t$  is the time the biological material spends inside the rock.

We can take  $t = \tau_{rock}$ , assuming the time the biological material spends inside the rock is the same as the time the rock spends in space.

Mileikowsky et al. (2000) gives a survival fraction according to Equation 3.

$$f_{tot,S} = f_{1,S} f_{2,S} f_{3,S}(\tau_{rock}) f_{4,S}(\tau_{rock}) f_{5,S}(\tau_{rock}) f_{6,S} \quad (3)$$

In Equation 3,  $S$  represents the size group of the rock, and the subscript number represents the risk type with respect to the biological material in the rock.

Substituting in the values from Mileikowsky et al. (2000), Equation 4:

$$f_{tot,S} = 0.5 \times 0.8 f_{3,S}(\tau_{rock}) f_{4,S}(\tau_{rock}) f_{5,S}(\tau_{rock}) \times 0.8, \quad (4)$$

where  $f_{3,S} = f_{GCR+SR} = \dots$  and  $f_{5,S} = f_{nat\ rad} = \dots$ . ‘Galactic cosmic rays’ is shortened to GCR; solar radiation is shortened to SR; and natural radiation is shortened to ‘nat rad’

## 2.1 Lifetime of These Rocks
